

SmartArt Smart Menu

Premium QR menu, floor-service dashboard, and kitchen display experience built for modern restaurants.

Project Type	Platform Focus	Primary Audience
Restaurant digital product	Mobile guest flows + tablet staff ops	Restaurants, cafes, and hospitality teams

This concept turns the restaurant menu into a complete service layer: guests browse dishes from a QR code, front-of-house staff manage live requests in a tablet-friendly control center, and the kitchen receives a clean ticket flow through a dedicated KDS-style board.

The visual direction stays premium and hospitality-first: dark Scandinavian UI, large touch targets, clear hierarchy, and restrained motion that supports service speed instead of distracting from it.

Live QR entry points for menu, admin, and kitchen workflows.

Problem

- Paper menus are slow to update, visually limited, and disconnected from daily restaurant operations.
- Manual handoff between guest, floor staff, and kitchen creates avoidable delays and ordering friction.
- Restaurants need a guest-facing experience that feels premium while still being fast enough for live service.

Solution

- A no-app QR menu that opens directly in the browser and keeps the browsing flow mobile-first.
- Detailed dish pages with rich imagery, price, calories, category context, and availability messaging.
- A floor-service dashboard that surfaces incoming orders, waiter requests, queue activity, and completion status.
- A kitchen display system that organizes tickets by status so the line can move quickly without opening the full admin panel.

Key Capabilities

- Guest menu flow with dedicated table access through QR routes.
- Tablet-friendly operations center with live feed, search, filters, and activity counters.
- Kitchen mode with status columns for new, preparing, ready, and completed orders.
- Call waiter / assistance requests designed for real-time staff follow-up.
- Reusable component architecture and multilingual support through Next.js + next-intl.
- Scalable product direction for multi-restaurant slugs, category-led menus, and admin-backed content updates.

Tech Snapshot

Framework	Next.js App Router
Language	TypeScript
Styling	Modern utility-first styling with custom premium UI patterns
UX Layer	Framer Motion for restrained motion and interaction polish
Localization	next-intl
Production Direction	Vercel-ready architecture with room for Prisma + PostgreSQL integration

Visual Highlights

The system is intentionally split into distinct but connected product surfaces: guest, floor, and kitchen.

Portfolio Summary

SmartArt Smart Menu is a premium hospitality web product that combines brand presentation with operations efficiency. Instead of treating the menu as a static brochure, the product turns it into a service workflow that connects guest discovery, waiter interaction, and kitchen execution.

For an Upwork portfolio, this project demonstrates the ability to deliver a polished vertical SaaS experience with strong UI craft, product thinking, and multi-surface UX across mobile, tablet, and live operations contexts.

Why this project is strong for Upwork

- Clear business use case with immediate value for restaurant owners.
- High-end interface design that feels custom rather than template-driven.
- Evidence of system thinking: guest journey, admin workflow, and kitchen execution all connect.
- Reusable web architecture that can be adapted for branded client delivery.

Prepared as an English portfolio PDF for Upwork submission.
