

SmartArt AI Website

A premium multilingual marketing website for SmartArt AI, built to present AI automation services, capture leads, and convert visitors into demo requests.

Live Domain	Website Type	Primary Goal
smartartai.se	Service website / lead generation platform	Showcase services and generate qualified inquiries

Project Overview

smartartai.se is the public-facing website for SmartArt AI. The site is designed as a high-impact digital sales layer for an AI automation business, with strong emphasis on premium presentation, motion-driven storytelling, and frictionless lead capture.

The homepage communicates the value proposition clearly: intelligent websites, AI assistants, and workflow automation built for Swedish businesses. The experience combines a dark visual identity, glassmorphism accents, animated typography, and a dynamic 3D hero background to create a modern, high-end brand impression.

Website Purpose

- Present SmartArt AI as a premium automation and AI solutions provider.
- Explain core service offers such as modern websites, AI assistants, and workflow automation.
- Convert visitors into demo requests or direct inquiries through modal-based forms and clear calls to action.
- Support content marketing through a localized blog section.

Core UX Features

- Interactive hero section with animated text and a client-only 3D canvas background.
- Service showcase cards with layered modal flows for discovery, qualification, and lead capture.
- Agent X demo experience connected to an OpenAI-powered API route.
- Localized Swedish and English content using locale-aware routing.
- Dedicated blog listing and article pages for SEO and authority building.
- Responsive navigation with mobile menu behavior and language switching.

Design & Frontend Implementation

The frontend is built around a premium dark UI language. The site uses custom theme tokens, gradient accents, subtle glass panels, strong contrast typography, and restrained motion to keep the interface feeling polished without becoming noisy.

- Next.js App Router for page structure and route handling.
- TypeScript for type-safe component and API development.
- Tailwind CSS v4 with custom theme variables in global styles.
- Framer Motion for headline animation, transitions, hover states, counters, and modal choreography.
- React Three Fiber and Three.js for the animated hero canvas.
- Google fonts via `next/font` using Plus Jakarta Sans and Inter.

Backend & Interactive Logic

Although the project is primarily a marketing website, it includes meaningful backend functionality that supports real business interaction instead of serving as a static brochure.

- An `agent-x` API route integrates with OpenAI using the `openai` SDK and streams live responses from `gpt-4o`.
- A `contact` API route uses Nodemailer with SMTP credentials stored in environment variables.
- The contact flow sends internal inquiry emails and can also trigger automatic customer replies.
- Secrets are kept server-side through environment variables rather than exposed in client code.

Localization & SEO Foundations

- Locale handling is implemented with `next-intl` and supports Swedish and English.
- The root layout includes metadata for title, description, Open Graph, Twitter cards, and robots directives.
- The domain `https://smartartai.se` is defined as the metadata base for canonical social sharing and SEO context.
- The blog structure adds long-form discoverable content to support search visibility and topical authority.

Technology Stack

Frontend Framework	Next.js App Router
Language	TypeScript
Styling	Tailwind CSS v4 + custom global theme variables
Animation	Framer Motion
3D / Visual Layer	React Three Fiber + Three.js
Internationalization	next-intl

AI Integration	OpenAI SDK (`gpt-4o`)
Email Handling	Nodemailer via SMTP
Fonts	`next/font` with Plus Jakarta Sans and Inter
Deployment Target	Vercel-oriented Next.js architecture
